Detailed report of the activity:

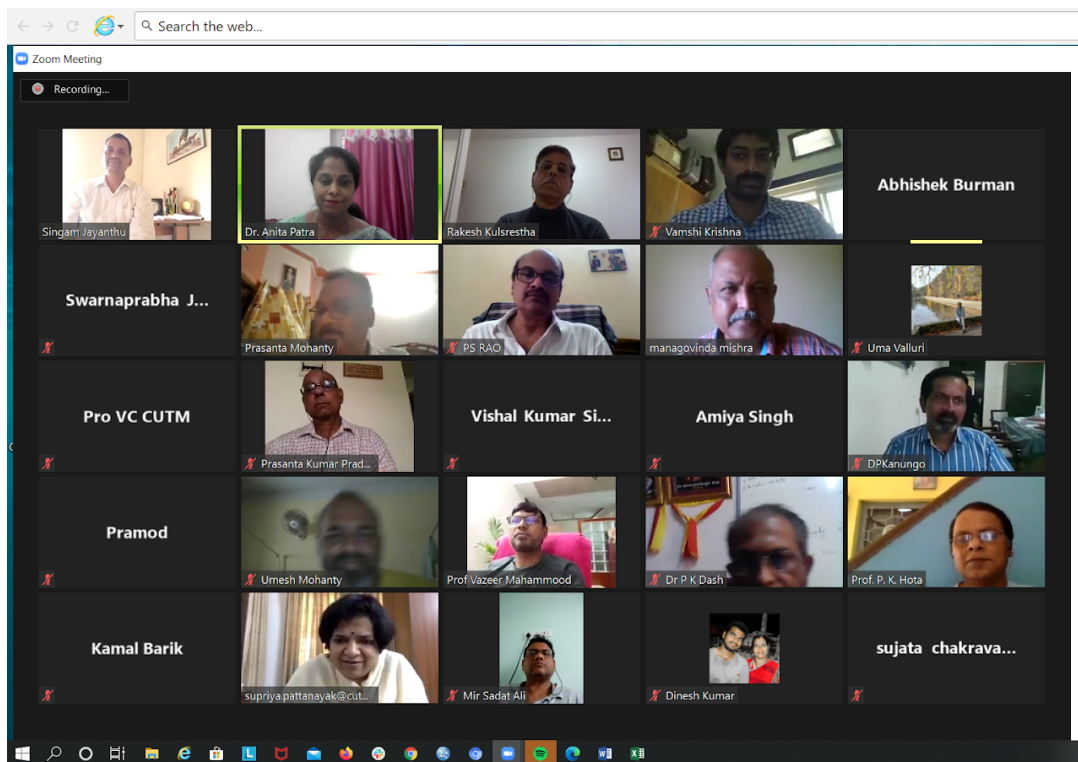

Journal metrics can be a useful quantitative tool for helping you decide where to submit your manuscript. However, any one metric only tells a part of the story of a journal's quality and impact. Each metric has its limitations so should never be considered in isolation. Journal metrics are a quantitative tool for helping you decide where to submit your manuscript for publication. However, any one metric only tells a part of the story of a journal's quality and impact. Each metric has its limitations so should never be considered in isolation. Use a few metrics together to reduce bias and ensure you get a rounded view. In addition, one must never make a submission decision based solely on publication metrics. There are many other qualitative aspects of a journal you should consider. These include its aims & scope, readership, and the

material it publishes. Above all, one should always be certain that the chosen journal is a good fit for the article to be written, otherwise the chances of the article being accepted will be limited. Once the article has been published there are also a range of useful metrics to help you understand its impact and to identify opportunities for future collaboration.

Criteria for Evaluating a Journal

- Scientific Rigor. A key indicator of journal quality is the scientific rigor of the publications published in the journal. ...
- Editorial Quality. ...
- Peer Review Process. ...
- Ethics. ...
- Editorial Board Members. ...
- Journal Reputation/Business Model. ...
- Author Rights and Copyright. ...
- Indexing Status

Journal metrics measure, compare, and often rank research and scholarly publications. They can also be referred to as journal rankings, journal importance, or a journal's impact. Journal metrics allow scholars and researchers to compare scholarly periodicals.

The discussion round in the workshop on “Suitable Journal Selection and Journal Metrics”
